

The header banner features a central landscape illustration with rolling green and yellow hills under a light blue sky with a small orange sun. On either side of the landscape are vertical panels containing a stylized DNA double helix with blue and green strands.

Genomes to Fields

Genotype by environment interaction in the 2014 Inbred Study

Celeste Falcon

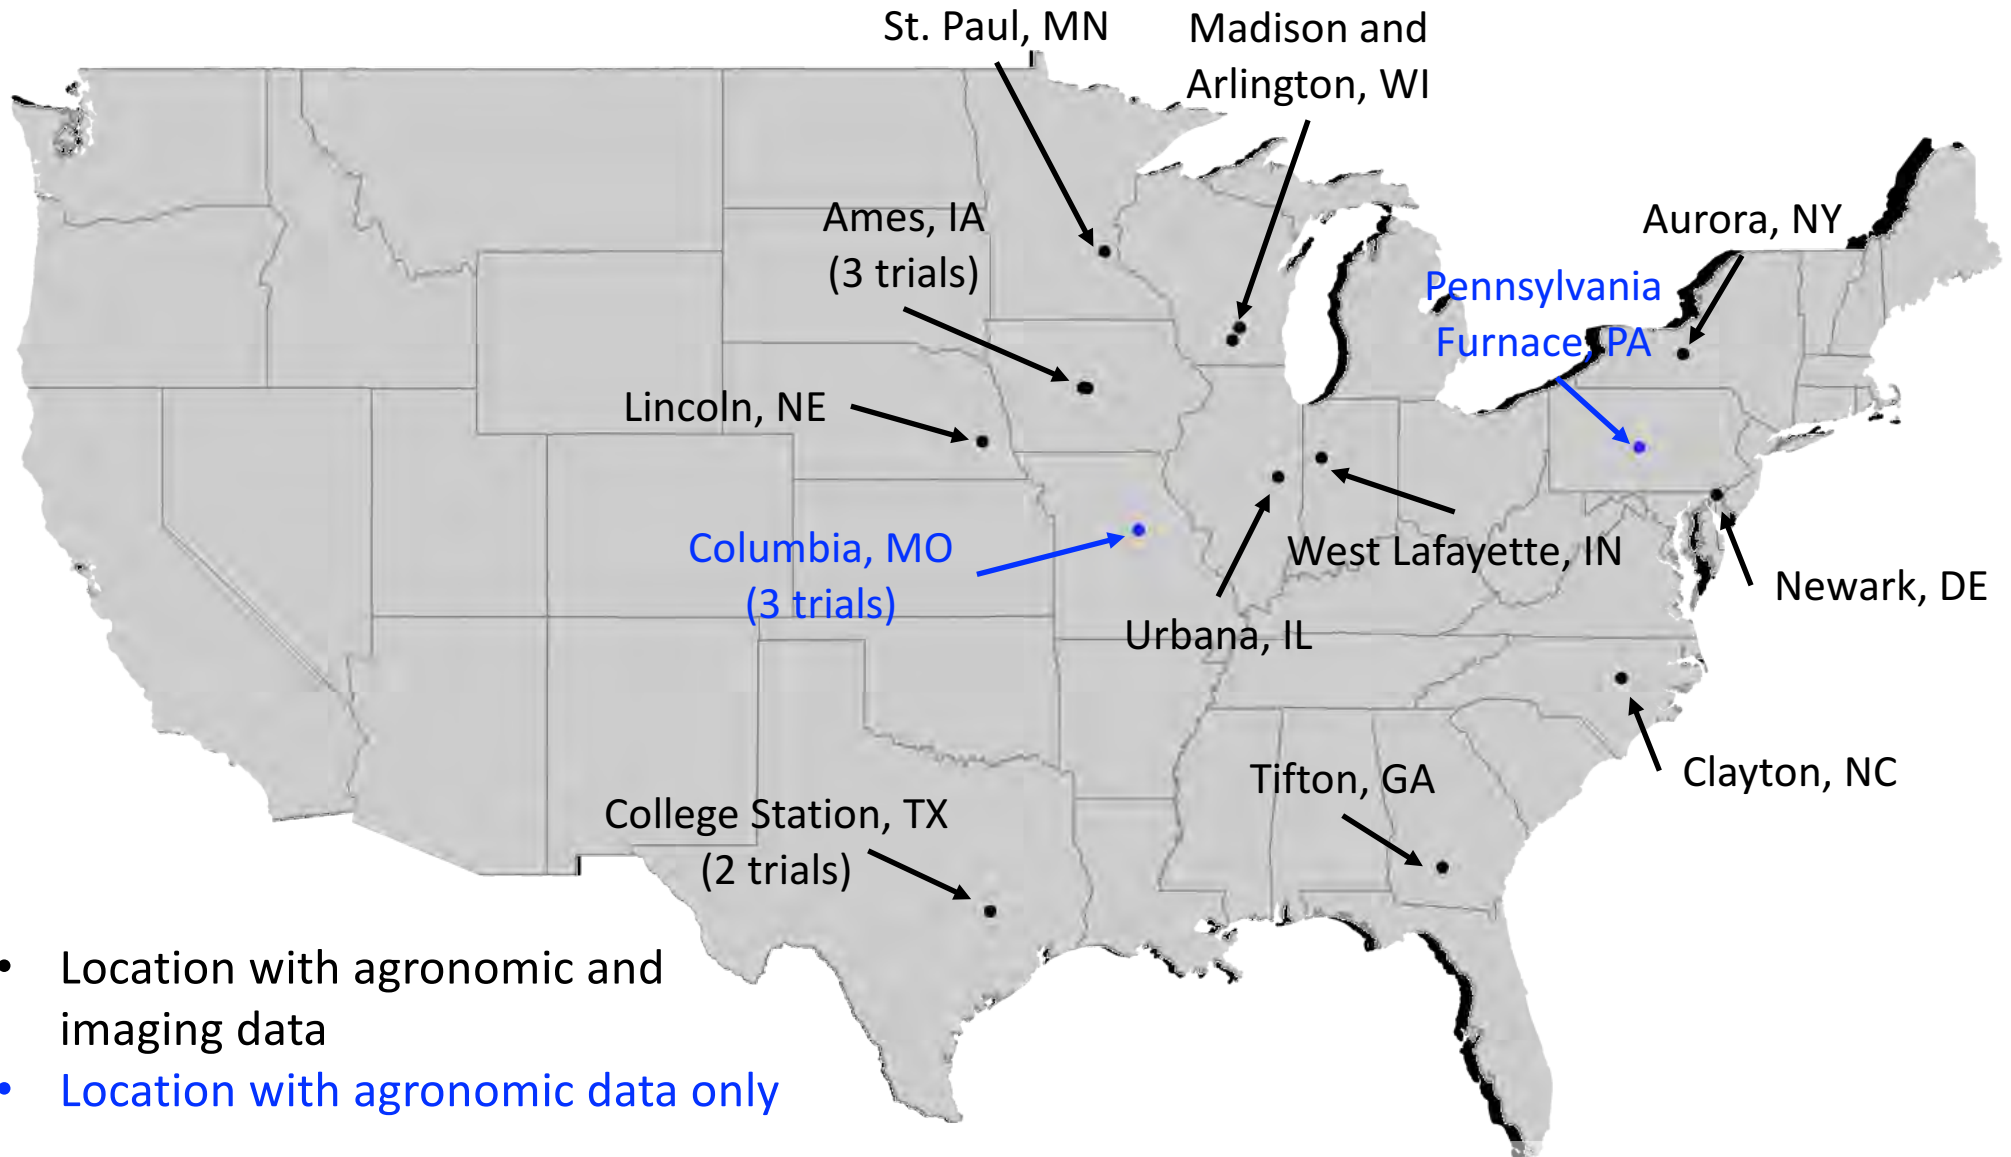

ASTA meeting
December 8, 2016

www.Genomes2Fields.org

2014 GxE inbred study—Questions to explore

- ✧ What correlations do we observe among agronomic and yield component traits?
- ✧ How do trait means change with respect to inbreds' year of release?
- ✧ For which traits does GxE interaction explain a significant portion of variation observed?
- ✧ What is the distribution of GxE among traits?
- ✧ Which inbreds show the most stability?
- ✧ How does GxE change with respect to inbreds' year of release?

2014 Inbred trials

- Location with agronomic and imaging data
- Location with agronomic data only

- 19 locations across 13 states
- 2 replicates per environment

Population: 31 inbred lines selected to represent range of locations and release date

Phenotypic data

✧ Agronomic traits

- ✧ Anthesis date (DAP)
- ✧ Silking date (DAP)
- ✧ Plant height

✧ Yield component traits

- ✧ Ear length
- ✧ Ear width
- ✧ Kernels per row
- ✧ Kernel row number
- ✧ Kernel weight

Yield Components: Imaging Output

Imaging Output: Ears

✧ **Kernel row number:** counted manually

✧ **Kernels per row**
 $= \text{Ear length} / \text{Kernel length}$

Imaging Output: Kernels

60

Other objects

- Not counted
- Not measured

✧ **Kernel weight** = Cup weight / kernel count

Grouped kernels:

- ✧ Counted accurately
- ✧ No measurements recorded

What correlations do we observe among agronomic and yield component traits?

How do trait means change w.r.t. year of release?

Quantifying GxE interaction

✧ Slope

✧ = 0: Type I stability

- ✧ consistent across environments

- ✧ Ex) Genotype A

✧ = 1: Type II stability

- ✧ mean response to environments

- ✧ Ex) Genotype B

✧ Mean square error

✧ Low MSE: Type III stability

- ✧ predictable performance across environments

- ✧ Ex) Genotype A has lower MSE in comparison to Genotype C

$$\text{Standardized MSE} = \text{MSE} / \text{mean trait value}^2$$

Figure adapted from Bernardo 2010

For which traits does GxE interaction explain a significant portion of variation observed?

GxE Regression Plot

What is the distribution of GxE among traits?

What is the distribution of GxE among traits?

Which inbreds show the most stability?

Which inbreds show the most stability?

Which inbreds show the most stability?

A634

Mean slope: 1.007

PHN82

Mean standardized MSE: 0.60

Which inbreds show the least stability?

740

Mean slope: 1.56

LH82

Mean standardized MSE: 1.12

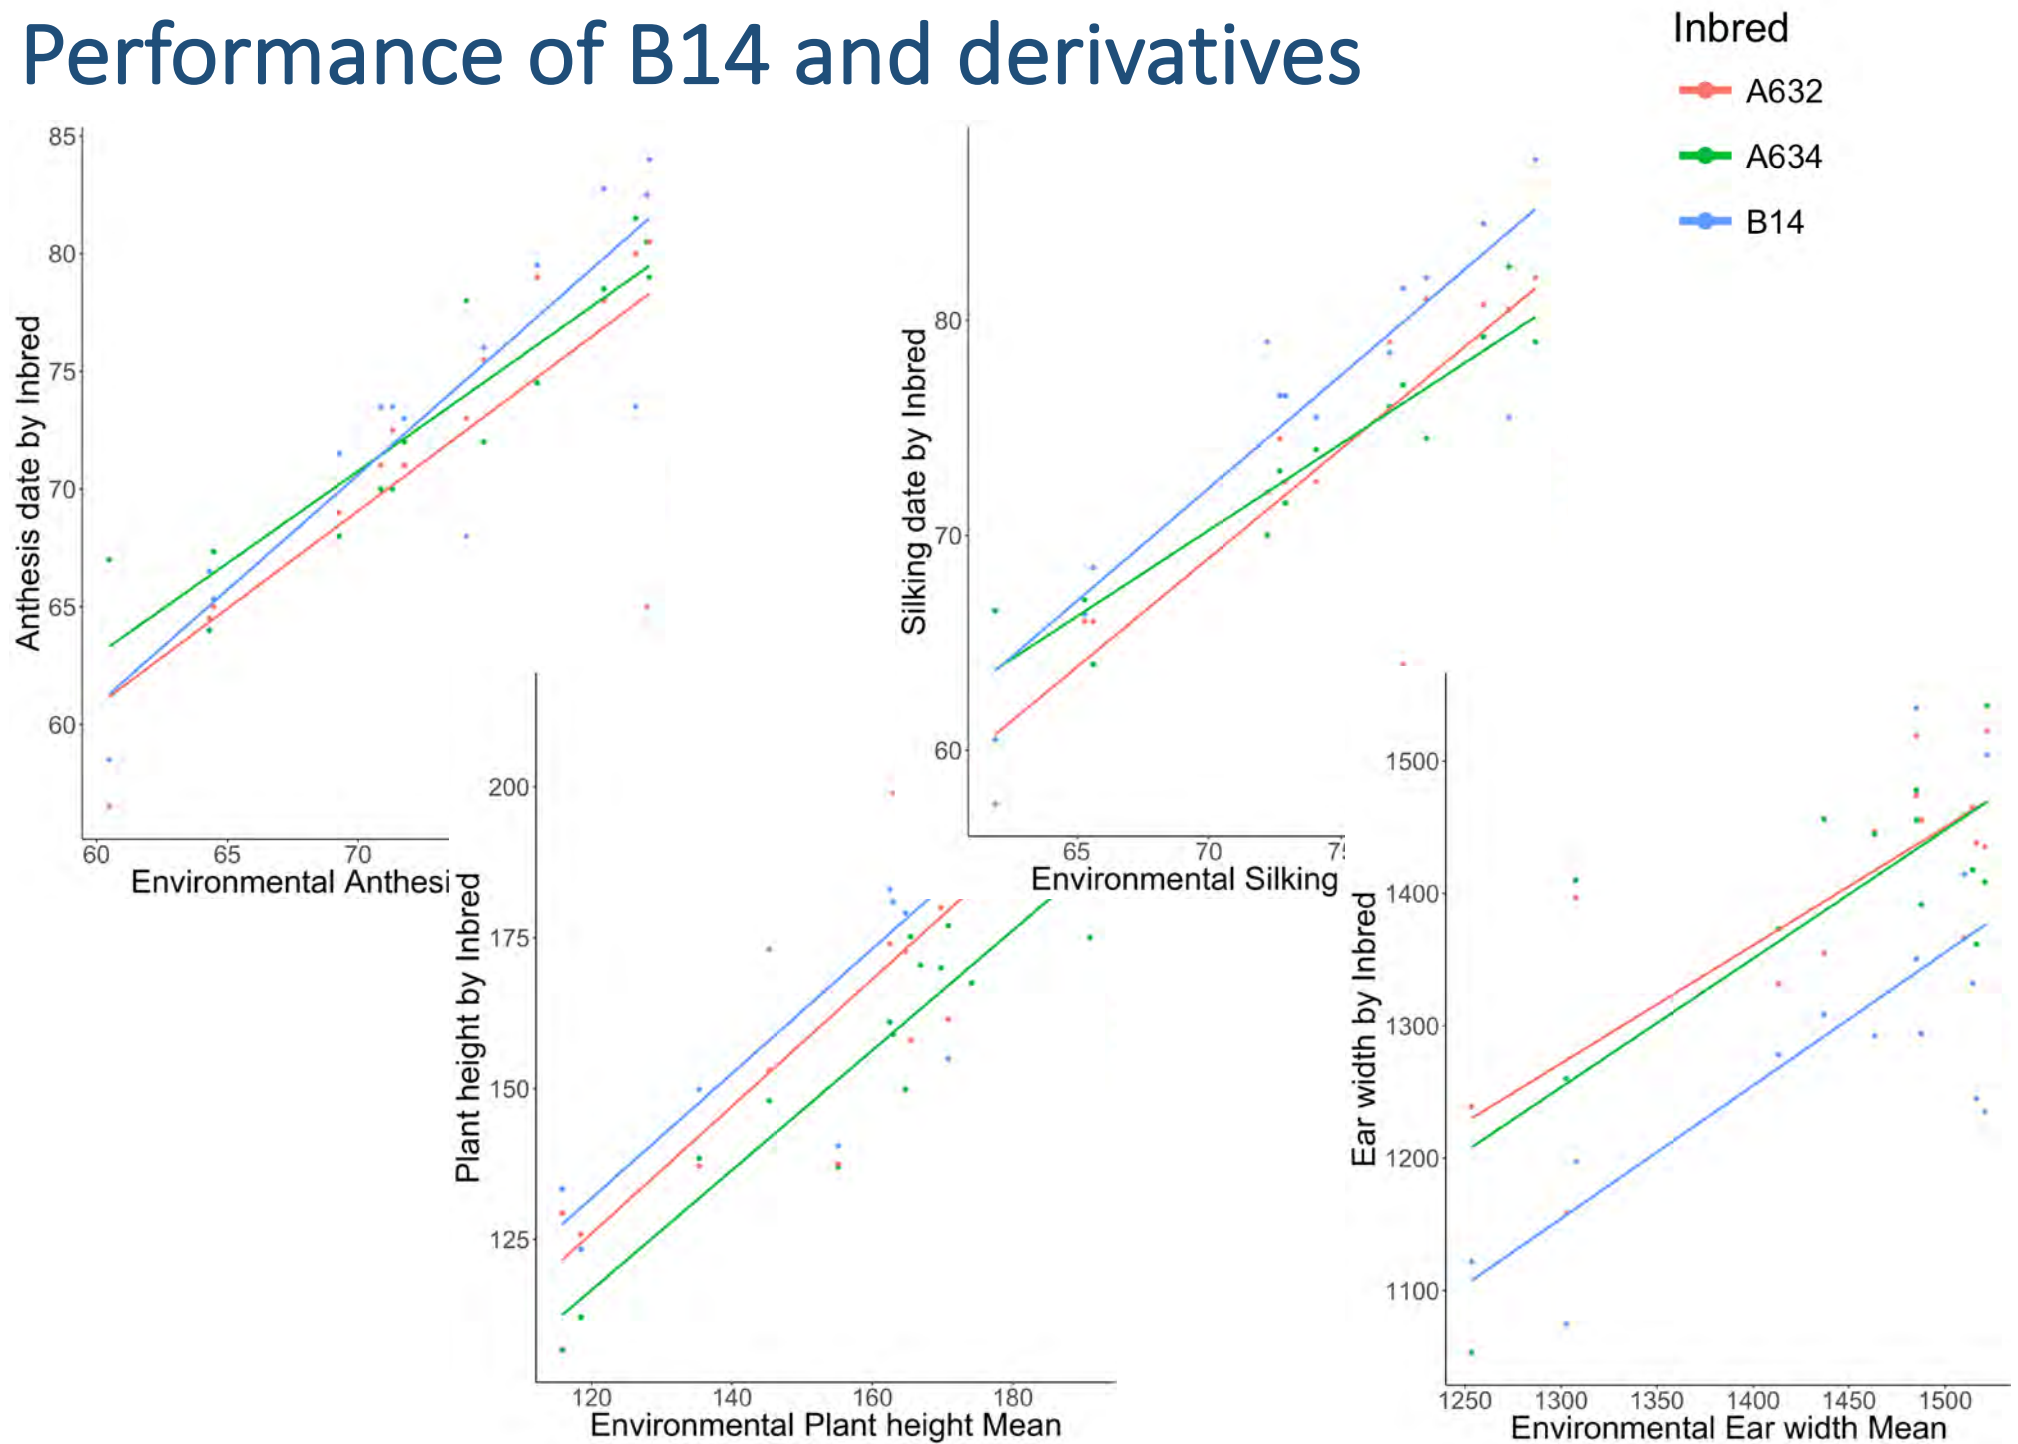

Which inbreds show the most stability?

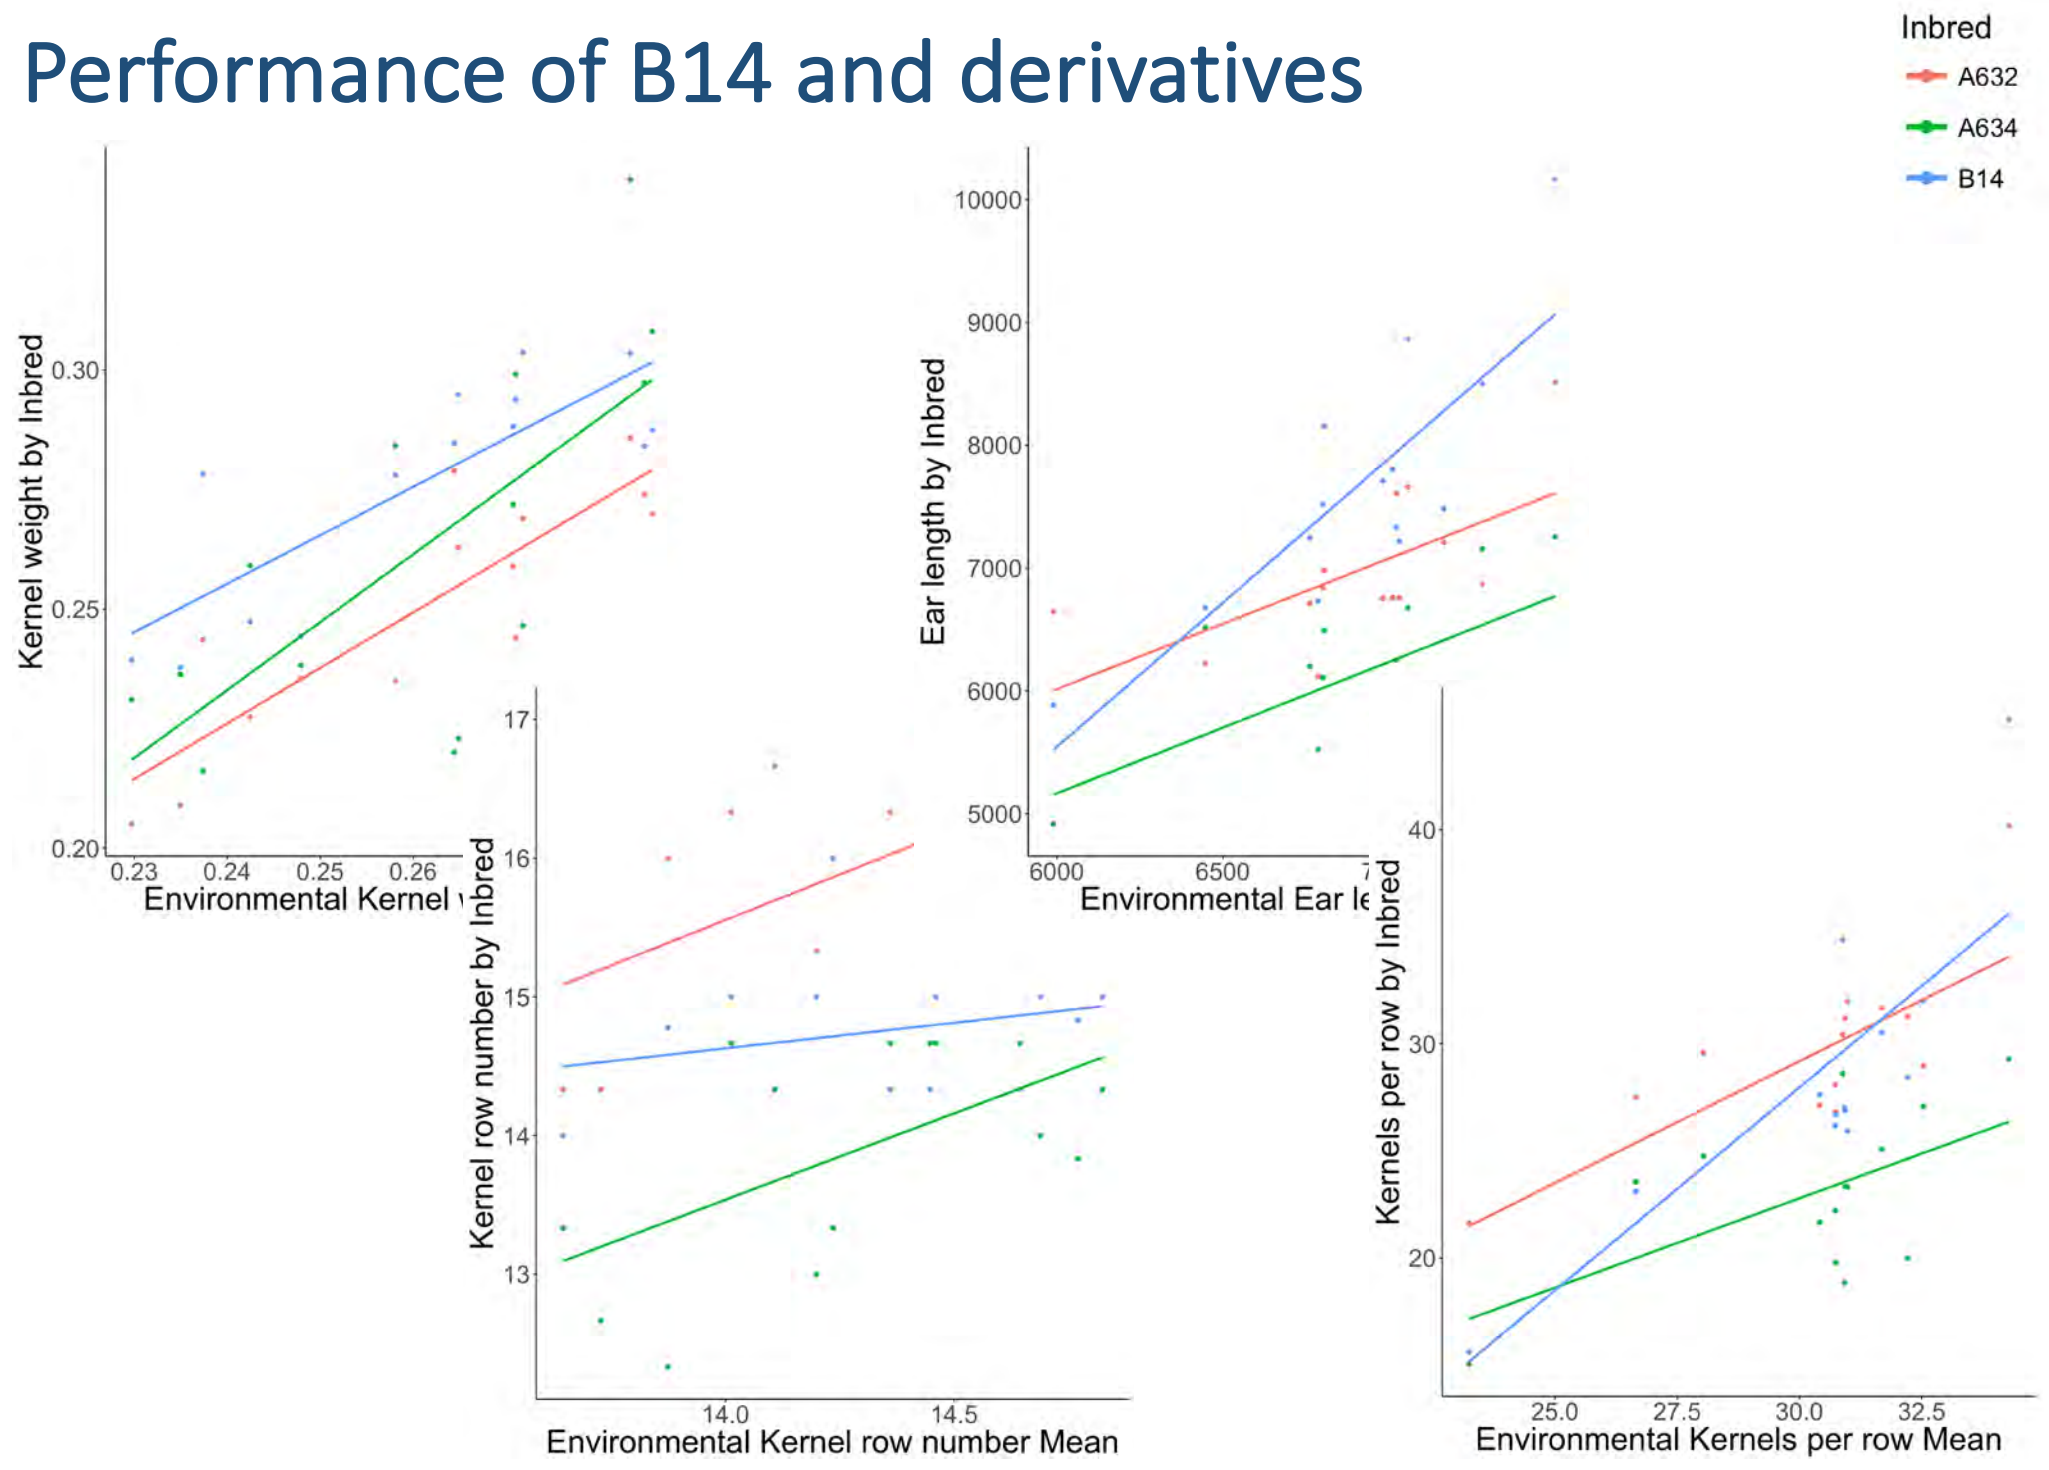

Genotype	Pedigree
A632	Mt42_X_B14(4)
A634	Mt42_X_B14(4)

Performance of B14 and derivatives

Performance of B14 and derivatives

How does GxE change w.r.t. inbreds' year of release?

How does GxE change w.r.t. inbreds' year of release?

Final remarks

- ✧ G x E interaction contributes significantly to trait values, making it important to consider in predictions
- ✧ Ear/kernel traits showed greater GxE interaction—good “indicator traits” for future experiments
- ✧ Some inbreds show better stability than others with exceptions for certain traits
- ✧ More recent inbreds show greater stability and improved predictability
- ✧ Much more to explore within this dataset and through incorporating the environmental data collected for each location
